## 2024\_28\_III\_OOPS Using Java Lab

### REC\_2028\_OOPS using Java\_Week 6\_MCQ

Attempt : 1

Total Mark : 15

Marks Obtained : 14

#### **Section 1 : MCQ**

1. What will be the output of the following Java program?

```
class Vehicle {  
    void startEngine() {  
        System.out.println("Vehicle engine started");  
    }  
}
```

```
class Car extends Vehicle {  
    void startEngine() {  
        System.out.println("Car engine started");  
    }  
}
```

```
class Main {  
    public static void main(String[] args) {
```

```
        Vehicle myVehicle = new Car();
        myVehicle.startEngine();
    }
}
```

**Answer**

Car engine started

**Status : Correct**

**Marks : 1/1**

2. What will be the output of the following program?

```
class A {
    int x = 10;
}
```

```
class B extends A {
    int x = 20;
}
```

```
class C extends B {
    int x = 30;
```

```
    void display() {
        System.out.println(x);
        System.out.println(super.x);
    }
}
```

```
class Test {
    public static void main(String[] args) {
        C obj = new C();
        obj.display();
    }
}
```

**Answer**

3020

**Status : Correct**

**Marks : 1/1**

3. What will be the output of the following code?

```
class A {  
    void display() {  
        System.out.println("Display A");  
    }  
}  
  
class B extends A {  
    void display() {  
        System.out.println("Display B");  
    }  
}  
  
class C extends B {  
    void display() {  
        super.display();  
    }  
}  
  
class Test {  
    public static void main(String[] args) {  
        C obj = new C();  
        obj.display();  
    }  
}
```

**Answer**

Display B

**Status : Correct**

**Marks : 1/1**

4. What will be the output of the following program?

```
class A {  
    public int i;  
    private int j;  
}  
class B extends A {
```

```
void display() {  
    super.j = super.i + 1;  
    System.out.println(super.i + " " + super.j);  
}  
}  
class inheritance {  
    public static void main(String args[]) {  
        B obj = new B();  
        obj.i=1;  
        obj.j=2;  
        obj.display();  
    }  
}
```

**Answer**

Compile Time Error

**Status : Correct**

**Marks : 1/1**

5. What will be the output of the following Java program?

```
class A {  
    void display() {  
        System.out.println("Class A");  
    }  
}
```

```
class B extends A {  
    void show() {  
        System.out.println("Class B");  
    }  
}
```

```
class C extends B {  
    void print() {  
        System.out.println("Class C");  
    }  
}
```

```
class Test {  
    public static void main(String[] args) {  
        C obj = new C();  
        obj.display();  
        obj.show();  
        obj.print();  
    }  
}
```

## **Answer**

## Class A Class B Class C

**Status :** Correct

Marks : 1/1

6. What will be the output of the following program?

```
class Vehicle {  
    String type = "Vehicle";  
}
```

```
class Car extends Vehicle {  
    String type = "Car";  
}
```

```
class Test {  
    public static void main(String[] args) {  
        Car c = new Car();  
        System.out.println(c.type);  
    }  
}
```

## Answer

Car

**Status :** Correct

Marks : 1/1

7. What will be the output of the following code?

```
class A {
```

```
241901076      241901076      241901076      241901076
int sum(int x) {
    return x + 2;
}

class B extends A {
    int sum(int x) {
        return super.sum(x) * 2;
    }
}

class C extends B {
    int sum(int x) {
        return super.sum(x) - 3;
    }
}

class Test {
    public static void main(String[] args) {
        C obj = new C();
        System.out.println(obj.sum(4));
    }
}
```

**Answer**

9

**Status :** Correct

**Marks :** 1/1

8. What will be the output of the following Java program?

```
241901076      241901076      241901076      241901076
class Parent {
    void show() {
        System.out.println("Parent class");
    }
}
class Child extends Parent {
    void show() {
        System.out.println("Child class");
    }
}
```

```
        }
    }
class Test {
    public static void main(String[] args) {
        Parent obj = new Child();
        obj.show();
    }
}
```

**Answer**

Child class

**Status : Correct**

**Marks : 1/1**

9. What will be the output of the following Java program?

```
class Test {
    void show(int a) {
        System.out.println("Integer method");
    }
    void show(String s) {
        System.out.println("String method");
    }
    public static void main(String[] args) {
        Test obj = new Test();
        obj.show(null);
    }
}
```

**Answer**

Compilation error due to ambiguous method call

**Status : Wrong**

**Marks : 0/1**

10. Which of the following is the correct way for class B to inherit from class A?

**Answer**

```
class B extends A {}
```

Status : Correct

Marks : 1/1

11. What will be the output of the following Java program?

```
class A {  
    int value = 10;  
    void display() {  
        System.out.println("A's display: " + value);  
    }  
}  
class B extends A {  
    int value = 20;  
    void display() {  
        System.out.println("B's display: " + value);  
    }  
}  
class Test {  
    public static void main(String[] args) {  
        A obj = new B();  
        obj.display();  
        System.out.println("Value: " + obj.value);  
    }  
}
```

Answer

B's display: 20 Value: 10

Status : Correct

Marks : 1/1

12. What will be the output of the following Java program?

```
class Vehicle {  
    void start() {  
        System.out.println("Vehicle starts");  
    }  
}  
class Car extends Vehicle {
```

```
void start() {  
    System.out.println("Car starts");  
}  
}  
class ElectricCar extends Car {  
    void start() {  
        System.out.println("Electric Car starts silently");  
    }  
}  
}  
class Test {  
    public static void main(String[] args) {  
        Vehicle v = new ElectricCar();  
        v.start();  
    }  
}
```

**Answer**

Electric Car starts silently

**Status : Correct**

**Marks : 1/1**

13. What will be the output of the following Java program?

```
class Test {  
    void display(int a, int b) {  
        System.out.println("Method 1");  
    }  
    void display(double a, double b) {  
        System.out.println("Method 2");  
    }  
    public static void main(String[] args) {  
        Test obj = new Test();  
        obj.display(10, 10.0);  
    }  
}
```

**Answer**

Method 2

**Status : Correct**

**Marks : 1/1**

14. Select the correct keyword for implementing inheritance through the class.

**Answer**

extends

**Status : Correct**

**Marks : 1/1**

15. Which of the following is true about method overriding in Java?

**Answer**

The method must have the same name, same parameters, and must be in different classes with an inheritance relationship

**Status : Correct**

**Marks : 1/1**

## 2024\_28\_III\_OOPS Using Java Lab

### 2028\_REC\_OOPS using Java\_Week 6\_Q1

Attempt : 1  
Total Mark : 10  
Marks Obtained : 10

#### **Section 1 : Coding**

##### **1. Problem Statement**

Elsa subscribes to a premium service with a base monthly cost, a service tax and an extra feature cost. Assist her in writing an inheritance program that takes input for these values and calculates the total monthly cost.

Refer to the below class diagram:

##### ***Input Format***

The first line of input consists of a double value, representing the base monthly cost.

The second line consists of a double value, representing the service tax.

The third line consists of a double value, representing the extra feature cost.

### **Output Format**

The output prints "Rs. X" where X is a double value, rounded off to two decimal places.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 10.0

2.5

5.0

Output: Rs. 17.50

### **Answer**

```
import java.util.Scanner;

class Subscription{
    protected double baseMonthlyCost;
    public Subscription(double baseMonthlyCost){
        this.baseMonthlyCost = baseMonthlyCost;
    }
    public double calculateMonthlyCost(){
        return baseMonthlyCost;
    }
}
class PremiumSubscription extends Subscription{
    private double serviceTax;
    private double extraFeatureCost;
    public PremiumSubscription(double baseMonthlyCost, double serviceTax,
double extraFeatureCost){
        super(baseMonthlyCost);
        this.serviceTax = serviceTax;
        this.extraFeatureCost = extraFeatureCost;
    }
    @Override
    public double calculateMonthlyCost(){
        return super.calculateMonthlyCost() + serviceTax + extraFeatureCost;
    }
}
```

```
public class Main {  
    public static void main(String[] args) {  
        Scanner scanner = new Scanner(System.in);  
  
        double baseMonthlyCost = scanner.nextDouble();  
        double serviceTax = scanner.nextDouble();  
        double extraFeatureCost = scanner.nextDouble();  
  
        PremiumSubscription premiumSubscription = new  
        PremiumSubscription(baseMonthlyCost, serviceTax, extraFeatureCost);  
  
        double totalMonthlyCost = premiumSubscription.calculateMonthlyCost();  
  
        System.out.printf("Rs. %.2f%n", totalMonthlyCost);  
        scanner.close();  
    }  
}
```

**Status :** Correct

**Marks :** 10/10

## 2024\_28\_III\_OOPS Using Java Lab

### 2028\_REC\_OOPS using Java\_Week 6\_Q2

Attempt : 1

Total Mark : 10

Marks Obtained : 10

#### Section 1 : Coding

##### 1. Problem Statement

Alice is managing an online store and wants to implement a program using inheritance to calculate the selling price of products after applying discounts.

Guide her by following the instructions:

Create a base class called Product with a public double attribute price. Create a subclass called DiscountedProduct, which extends Product and includes a private double attribute discount rate. This subclass has a method called calculateSellingPrice() to determine the final selling price after applying the discount.

Formula: Discounted selling price = price \* (1 - discount rate)

***Input Format***

The first line of input consists of a double value  $p$ , the initial price of the product.

The second line consists of a double value  $d$ , the discount rate.

### ***Output Format***

The output prints "Rs. X", where  $X$  is a double value, representing the calculated discounted selling price, rounded off to two decimal places.

If the discount rate is greater than 1, print "Not applicable".

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 50.00

0.20

Output: Rs. 40.00

### ***Answer***

```
import java.util.Scanner;

class Product{
    public double price;
    public Product(double price){
        this.price = price;
    }
}

class DiscountedProduct extends Product{
    private double discountRate;
    public DiscountedProduct(double price, double discountRate){
        super(price);
        this.discountRate = discountRate;
    }
    public double calculateSellingPrice(){
        if (discountRate > 1){
            return -1;
        }
        return price * (1 - discountRate);
    }
}
```

```
}

class ProductPricing {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);

        double initialPrice = scanner.nextDouble();
        double discountRate = scanner.nextDouble();
        DiscountedProduct discountedProduct = new
DiscountedProduct(initialPrice, discountRate);
        double sellingPrice = discountedProduct.calculateSellingPrice();

        if (sellingPrice >= 0) {
            System.out.printf("Rs. %.2f%n", sellingPrice);
        } else {
            System.out.println("Not applicable");
        }
        scanner.close();
    }
}
```

**Status : Correct**

**Marks : 10/10**

### 2028\_REC\_OOPS using Java\_Week 6\_Q3

Attempt : 1  
Total Mark : 10  
Marks Obtained : 10

#### **Section 1 : Coding**

##### **1. Problem Statement**

Preethi is working on a project to automate sales tax calculations for items in a store. She wants to create a program that takes the price of an item and the sales tax rate as input and calculates the final price of the item after applying the sales tax.

Write a program using the class SalesTaxCalculator, which contains an overloaded method named calculateFinalPrice to handle both integer and double inputs. The program should also include a Main class that takes user input, calls the appropriate method from SalesTaxCalculator, and prints the final price of the item.

Formula Used: Final price = price + ((price \* sales tax rate) / 100)

***Input Format***

The first line of input consists of an integer price (the price of the item for integer inputs).

The second line of input consists of an integer taxRate (the sales tax rate for integer inputs).

The third line of input consists of a double price (the price of the item for double inputs).

The fourth line of input consists of a double taxRate (the sales tax rate for double inputs).

### ***Output Format***

The first line of output prints an integer, representing the final price of the item after applying the sales tax for integer inputs (a and b).

The second line prints a double value, representing the final price of the item after applying the sales tax for double-value inputs (m and n), rounded to two decimal places.

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 100

10

100.0

5.0

Output: 110

105.00

### ***Answer***

```
import java.util.Scanner;  
  
// You are using Java  
class SalesTaxCalculator {  
  
    // Method to calculate final price for integer inputs  
    public static int calculateFinalPrice(int price, int taxRate) {  
        return price + (price * taxRate) / 100;
```

```
}

// Method to calculate final price for double inputs
public static double calculateFinalPrice(double price, double taxRate) {
    return price + (price * taxRate) / 100;
}

class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        int intPrice = scanner.nextInt();
        int intTaxRate = scanner.nextInt();
        double doublePrice = scanner.nextDouble();
        double doubleTaxRate = scanner.nextDouble();

        int finalPriceInt = SalesTaxCalculator.calculateFinalPrice(intPrice,
intTaxRate);
        double finalPriceDouble =
SalesTaxCalculator.calculateFinalPrice(doublePrice, doubleTaxRate);

        System.out.println(finalPriceInt);
        System.out.format("%.2f", finalPriceDouble);
    }
}
```

**Status :** Correct

## 2024\_28\_III\_OOPS Using Java Lab

### 2028\_REC\_OOPS using Java\_Week 6\_Q4

Attempt : 1

Total Mark : 10

Marks Obtained : 10

#### **Section 1 : Coding**

##### **1. Problem Statement**

Mr.Kapoor wants to create a program to calculate the volume of a Cuboid and a Cube using method overriding.

Implements a base class Cuboid with attributes for length, width, and height. Include a method calculateVolume() that computes the volume of the cuboid.

Extends the base class with a subclass Cube representing a cube, where all sides are equal. Override the calculateVolume() method in the Cube class to compute the volume of the cube.

The program should take user input for the dimensions of the cuboid and the side length of the cube and display the calculated volumes with two decimal places.

### ***Input Format***

The first line of input consists of 3 space-separated double values, representing the cuboid length, width, and height, respectively.

The second line consists of a double value, representing the side length of the cube.

### ***Output Format***

The first line of output prints the volume of the cuboid, rounded off to two decimal places.

The second line prints the volume of the cube, rounded off to two decimal places.

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 60.0 60.0 60.0  
50.0

Output: Volume of Cuboid: 216000.00  
Volume of Cube: 125000.00

### ***Answer***

```
import java.util.Scanner;  
  
// You are using Java  
class Cuboid {  
    protected double length;  
    protected double width;  
    protected double height;  
  
    public Cuboid(double length, double width, double height) {  
        this.length = length;  
        this.width = width;  
        this.height = height;  
    }  
  
    public double calculateVolume() {
```

```

        return length * width * height;
    }

class Cube extends Cuboid {
    public Cube(double side) {
        super(side, side, side); // Call the superclass constructor with equal sides
    }

    @Override
    public double calculateVolume() {
        return length * length * length; // Volume of the cube
    }
}

public class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);

        double cuboidLength = scanner.nextDouble();
        double cuboidWidth = scanner.nextDouble();
        double cuboidHeight = scanner.nextDouble();

        // Regular object instantiation for Cuboid
        Cuboid cuboid = new Cuboid(cuboidLength, cuboidWidth, cuboidHeight);
        System.out.printf("Volume of Cuboid: %.2f\n", cuboid.calculateVolume());

        double cubeSide = scanner.nextDouble();

        // Upcasting - Using superclass reference for subclass object (DMD)
        Cuboid cube = new Cube(cubeSide); // Upcasting
        System.out.printf("Volume of Cube: %.2f", cube.calculateVolume()); // Calls
        Cube's method dynamically

        scanner.close();
    }
}

```

## 2024\_28\_III\_OOPS Using Java Lab

### 2028\_REC\_OOPS using Java\_Week 6\_Q5

Attempt : 1

Total Mark : 10

Marks Obtained : 0

#### **Section 1 : Coding**

##### **1. Problem statement:**

Tim was tasked with developing a grocery shopping app. You have a class hierarchy that includes Item, Produce, and OrganicProduce. Your goal is to calculate the total cost of a shopping list, which may contain a mix of regular produce and organic produce items. Additionally, you need to apply discounts to organic items. Apply a 10% discount on organic produce items

Class Hierarchy:

Item: Base class for all items.

Produce: Subclass of Item for regular produce items.

OrganicProduce: Subclass of Produce for organic produce items.

### ***Input Format***

The first line of input consists of an integer, 'n'.

For each 'n' item, the user will provide:

- A string 'type' representing the item type ('Regular' or 'Organic').
- A string 'name' represents the item name.
- A double 'price' represents the item price.

### ***Output Format***

The output will display the total cost of the shopping list, including discounts on organic items.

Refer to the sample output for format specifications.

### ***Sample Test Case***

Input: 1

Regular Banana 1.99

Output: 1.99

### ***Answer***

```
import java.util.Scanner;  
  
class Item {  
    protected String name;  
    protected double price;  
  
    public Item(String name, double price) {  
        this.name = name;  
        this.price = price;  
    }  
  
    public double getPrice() {  
        return price;  
    }  
}  
  
class Produce extends Item {
```

```

        public Produce(String name, double price) {
            super(name, price);
        }
    }

    class OrganicProduce extends Produce {
        public OrganicProduce(String name, double price) {
            super(name, price);
        }

        public double getDiscountedPrice() {
            return price * 0.9; // Applying a 10% discount
        }
    }

    public class Main {
        public static void main(String[] args) {
            Scanner sc = new Scanner(System.in);

            int n = sc.nextInt();
            sc.nextLine(); // Consume newline

            double totalCost = 0.0;

            for (int i = 0; i < n; i++) {
                String type = sc.next();
                String name = sc.next();
                double price = sc.nextDouble();

                if (type.equals("Regular")) {
                    Item item = new Produce(name, price);
                    totalCost += item.calculateCost();
                } else if (type.equals("Organic")) {
                    Item item = new OrganicProduce(name, price);
                    totalCost += item.calculateCost();
                }
            }

            System.out.printf("%.2f%n", totalCost);
        }
    }

```

## 2024\_28\_III\_OOPS Using Java Lab

### REC\_2028\_OOPS using Java\_Week 6\_PAH

Attempt : 1

Total Mark : 40

Marks Obtained : 30

#### **Section 1 : Coding**

##### **1. Problem Statement**

Sharon, a software developer, is working on a project to automate velocity calculations for various objects. She wants to create a class named VelocityCalculator with overloaded methods calculateVelocity to calculate the velocity. One method will accept distance in meters and time in seconds as integers, while another will accept distance and time as doubles.

Help her in completing the project.

Formula: Velocity = distance / time

##### ***Input Format***

The first line of input consists of an integer, representing the distance in meters

(for the integer method).

The second line consists of an integer, representing the time in seconds (for the integer method).

The third line consists of a double value, representing the distance in meters (for the double method).

The fourth line consists of a double value, representing the time in seconds (for the double method).

### ***Output Format***

The first line prints the velocity calculated using the integer inputs in the format:

Velocity with integer inputs: <velocity> m/s

The second line prints the velocity calculated using the double inputs in the format:

Velocity with double inputs: <velocity> m/s

Note:

The velocity for the double inputs should be printed with two decimal places.

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 100

10

100.5

10.2

Output: Velocity with integer inputs: 10 m/s

Velocity with double inputs: 9.85 m/s

### ***Answer***

```
import java.util.Scanner;

class VelocityCalculator {
    // Method to calculate velocity with integer inputs
    public static int calculateVelocity(int distance, int time) {
        return distance / time; // Cast to double for accurate division
    }

    // Method to calculate velocity with double inputs
    public static double calculateVelocity(double distance, double time) {
        return distance / time; // Direct division with double
    }
}

public class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);

        int distanceInt = scanner.nextInt();
        int timeInt = scanner.nextInt();

        double distanceDouble = scanner.nextDouble();
        double timeDouble = scanner.nextDouble();

        int velocityInt = VelocityCalculator.calculateVelocity(distanceInt, timeInt);
        double velocityDouble =
            VelocityCalculator.calculateVelocity(distanceDouble, timeDouble);

        System.out.println("Velocity with integer inputs: " + velocityInt + " m/s");
        System.out.printf("Velocity with double inputs: %.2f m/s", velocityDouble);

        scanner.close();
    }
}
```

**Status :** Correct

**Marks :** 10/10

## 2. Problem Statement

In a company, each manager has a unique employee ID and a monthly salary. You are required to design a program that will calculate and display the annual(12 months) salary of a manager based on the input details provided by the user.

Implement the solution using a single inheritance approach.

**Employee:** The base class with attributes name and employeeID.

**Manager:** The derived class inheriting from Employee, with an additional attribute salary.

#### ***Input Format***

The first line of input consists of a string name, representing the manager's name.

The second line of input consists of an integer employeeID, representing the manager's employee ID.

The third line of input consists of a double salary, representing the manager's monthly salary.

#### ***Output Format***

The first line of output prints: Name: <name>

The second line of output prints: Annual Salary: Rs. <annual\_salary> (rounded to two decimal places).

Refer to the sample output for formatting specifications.

#### ***Sample Test Case***

Input: Davis  
234  
28750.75

Output: Name: Davis  
Annual Salary: Rs. 345009.00

#### ***Answer***

```
import java.util.Scanner;
import java.text.DecimalFormat;

// You are using Java
class Employee {
    // Attributes for Employee class
    protected String name;
    protected int employeeID;

    // Constructor for Employee class
    public Employee(String name, int employeeID) {
        this.name = name;
        this.employeeID = employeeID;
    }
}

class Manager extends Employee {
    // Additional attribute for Manager class
    private double salary;

    // Constructor for Manager class
    public Manager(String name, int employeeID, double salary) {
        super(name, employeeID); // Call to the base class constructor
        this.salary = salary;
    }

    // Method to calculate annual salary
    public double calculateAnnualSalary() {
        return salary * 12; // Annual salary calculation
    }
}

class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        DecimalFormat df = new DecimalFormat("0.00");

        String name = scanner.nextLine();
        int employeeID = scanner.nextInt();
        double salary = scanner.nextDouble();

        Manager manager = new Manager(name, employeeID, salary);
    }
}
```

```
        System.out.println("Name: " + manager.name);
        System.out.println("Annual Salary: Rs. " +
df.format(manager.calculateAnnualSalary()));

        scanner.close();
    }
}
```

**Status : Correct**

### 3. Problem Statement

Ram is designing a program to calculate the Body Mass Index (BMI). Your task is to assist him by following the given specifications.

Create a base class BMIcalculator with a method calculateBMI() to compute BMI using the formula weight / (height \* height).

Extend the class with a subclass CustomBMIcalculator that overrides the method calculateBMI() to calculate BMI based on custom criteria, assigning categories such as "Underweight," "Normal Weight," "Overweight," or "Obese."

BMI < 18.5, category = "Underweight"  
BMI >= 18.5 &lt; 24.9, category = "Normal Weight"  
BMI >= 25 &lt; 29.9, category = "Overweight"  
else  
category = "Obese"

Implement user input for weight and height and display both the standard and custom BMI calculations.

#### ***Input Format***

The first line of input consists of a double value, representing the weight in kgs.

The second line consists of a double value, representing the height in meters.

#### ***Output Format***

The first line of output prints: "Standard BMI Calculation:"

The second line of output prints: "BMI: " followed by the calculated BMI value (to

two decimal places).

The third line of output prints: "Custom BMI Calculation:"

The fourth line of output prints: "Category: " followed by the BMI category.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 69.7

2.6

Output: Standard BMI Calculation:

BMI: 10.31

Custom BMI Calculation:

Category: Underweight

### **Answer**

```
import java.util.Scanner;

class BMIcalculator {
    // Method to calculate standard BMI
    public double calculateBMI(double weight, double height) {
        return weight / (height * height);
    }
}

class CustomBMIcalculator extends BMIcalculator {
    // Method to calculate custom BMI and determine the category
    public String calculateCustomBMI(double weight, double height) {
        double bmi = calculateBMI(weight, height);
        String category;

        if (bmi < 18.5) {
            category = "Underweight";
        } else if (bmi >= 18.5 && bmi < 24.9) {
            category = "Normal Weight";
        } else if (bmi >= 25 && bmi < 29.9) {
            category = "Overweight";
        } else {
```

```

        category = "Obese";
    }

    return category;
}
}

public class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);

        double weight = scanner.nextDouble();
        double height = scanner.nextDouble();

        BMIcalculator bmiCalculator = new BMIcalculator(weight, height);
        System.out.println("Standard BMI Calculation:");
        bmiCalculator.displayBMI();

        CustomBMIcalculator customBMIcalculator = new
        CustomBMIcalculator(weight, height);
        System.out.println("Custom BMI Calculation:");
        customBMIcalculator.displayCustomBMI();

        scanner.close();
    }
}

```

#### 4. Problem Statement

John is planning a long road trip and wants to calculate the distance his car can travel based on its speed and fuel capacity. As John knows that different cars have different fuel efficiencies, he wants a program that can help him estimate the travel distance for any given car.

To do this, you are tasked with creating a program that calculates the travel distance of a car based on its speed and fuel capacity. The calculation is simple and follows the formula:

$$\text{Travel Distance} = \text{Speed} * \text{Fuel Capacity}$$

You need to model this system using a Vehicle class and a Car class. The Vehicle class will have attributes for the speed and fuel capacity, while the Car class will inherit from the Vehicle class and include a method to calculate the travel distance.

### ***Input Format***

The first line of input consists of a double value representing the speed of the car in km/h.

The second line of input consists of a double value representing the fuel capacity of the car in liters.

### ***Output Format***

The first line should print "Speed: X km/h", where X is the speed of the car, rounded to two decimal places.

The second line should print "Fuel Capacity: Y liters", where Y is the fuel capacity of the car, rounded to two decimal places.

The third line should print "Travel Distance: Z km", where Z is the total travel distance the car can cover, rounded to two decimal places.

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 10.0

1.0

Output: Speed: 10.00 km/h

Fuel Capacity: 1.00 liters

Travel Distance: 10.00 km

### ***Answer***

```
import java.util.Scanner;  
  
// You are using Java  
class Vehicle {  
    // Attributes for speed and fuel capacity  
    protected double speed;
```

```

protected double fuelCapacity;

// Constructor to initialize speed and fuel capacity
public Vehicle(double speed, double fuelCapacity) {
    this.speed = speed;
    this.fuelCapacity = fuelCapacity;
}

class Car extends Vehicle {
    // Constructor to initialize the Car object
    public Car(double speed, double fuelCapacity) {
        super(speed, fuelCapacity);
    }

    // Method to calculate travel distance
    public double calculateTravelDistance() {
        return speed * fuelCapacity;
    }
}

public class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);

        double speed = scanner.nextDouble();
        double fuelCapacity = scanner.nextDouble();

        Car car = new Car(speed, fuelCapacity);

        System.out.println("Speed: " + String.format("%.2f", car.speed) + " km/h");
        System.out.println("Fuel Capacity: " + String.format("%.2f", car.fuelCapacity)
+ " liters");
        System.out.println("Travel Distance: " + String.format("%.2f",
car.calculateTravelDistance()) + " km");

        scanner.close();
    }
}

```

#### **Section 1 : Coding**

##### **1. Problem Statement**

A painter needs to determine the cost to paint different shapes based on their surface area. The program should be designed to handle the area of a sphere and calculate the total painting cost using the following formulas:

Area of sphere:  $\text{Area} = 4 * \pi * r^2$  where  $\pi = 3.14$   
Total painting cost: Cost = cost per square meter \* area of sphere

The program will consist of three classes:

Shape class: This class should set the shape type and radius.  
Area class: This class should extend Shape to calculate the area.  
Cost class: This class should extend Area to calculate the total painting cost.

##### ***Input Format***

The input consists of a string representing the shape type, a double value

representing the radius, and another double value representing the cost per square meter on each line.

### **Output Format**

For a valid shape type of "Sphere":

- The first line prints: "Area of Sphere is: <calculated\_area>" rounded to two decimal places.
- The second line prints: "Cost to paint the shape is: <total\_painting\_cost>" rounded to two decimal places.

For any other shape types, print: "Invalid type".

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: Sphere

3.4

5.8

Output: Area of Sphere is: 145.19

Cost to paint the shape is: 842.12

### **Answer**

```
import java.util.Scanner;

public class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        String s = scanner.next();
        Cost shape = new Cost();
        shape.setShape(s, scanner);
        double costToPaint = scanner.nextDouble();
        shape.calculateArea();
        shape.setCost(costToPaint);
        shape.calculateCost();
    }
}
```

## 2. Problem Statement

A bank provides two types of deposit schemes: Fixed Deposits (FD) and Recurring Deposits (RD). Customers want to calculate the interest they can earn based on their selected scheme.

Develop a Java program using inheritance to compute the interest for FD and RD. The program should include:

A base class Account with attributes accountHolder and principalAmount, along with a method for interest calculation. A subclass FixedDeposit that calculates interest for FD. A subclass RecurringDeposit that calculates interest for RD.

Formulas Used:

Interest for FD:  $(\text{principal amount} * \text{duration in years} * \text{rate of interest}) / 100$

Interest for RD:  $(\text{maturity amount} * \text{duration in months} * \text{rate of interest}) / (12 * 100)$ , where maturity amount = monthly deposit \* duration in months.

### *Input Format*

The first line of input consists of the choice (1 for FD, 2 for RD).

If the choice is 1, the following lines consist of account holder (string), principal amount (double), duration in years (int), and rate of interest (double).

If the choice is 2, the following lines consist of account holder (string), monthly deposit (int), duration in months (int), and rate of interest (double).

### *Output Format*

The output prints the calculated interest with one decimal place in the following format.

For choice 1: "Interest for FD: <calculated interest >"

For choice 2: "Interest for FD: <calculated interest >"

Refer to the sample output for formatting specifications.

### Sample Test Case

Input: 1

Alice

50000.56

5

6.5

Output: Interest for FD: 16250.2

### Answer

```
import java.util.Scanner;

// You are using Java
class Account {
    protected String accountHolder;
    protected double principalAmount;

    public Account(String accountHolder, double principalAmount) {
        this.accountHolder = accountHolder;
        this.principalAmount = principalAmount;
    }

    // This method will be overridden in subclasses
    public double calculateInterest() {
        return 0.0;
    }
}

class FixedDeposit extends Account {
    private int durationInYears;
    private double rateOfInterest;

    public FixedDeposit(String accountHolder, double principalAmount, int
durationInYears, double rateOfInterest) {
        super(accountHolder, principalAmount);
        this.durationInYears = durationInYears;
        this.rateOfInterest = rateOfInterest;
    }

    @Override
    public double calculateInterest() {
```

```
        return (principalAmount * durationInYears * rateOfInterest) / 100;
    }

class RecurringDeposit extends Account {
    private double monthlyDeposit;
    private int durationInMonths;
    private double rateOfInterest;

    public RecurringDeposit(String accountHolder, double monthlyDeposit, int
durationInMonths, double rateOfInterest) {
        super(accountHolder, monthlyDeposit * durationInMonths); // Maturity
amount is calculated here
        this.monthlyDeposit = monthlyDeposit;
        this.durationInMonths = durationInMonths;
        this.rateOfInterest = rateOfInterest;
    }

    @Override
    public double calculateInterest() {
        double maturityAmount = monthlyDeposit * durationInMonths;
        return (maturityAmount * durationInMonths * rateOfInterest) / (12 * 100);
    }
}

public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);

        int choice = sc.nextInt();

        switch (choice) {
            case 1:
                sc.nextLine();
                String fdName = sc.nextLine();
                double fdPrincipal = sc.nextDouble();
                int fdDuration = sc.nextInt();
                double fdRate = sc.nextDouble();

                FixedDeposit fd = new FixedDeposit(fdName, fdPrincipal, fdDuration,
fdRate);
                System.out.printf("Interest for FD: %.1f", fd.calculateInterest());
                break;
        }
    }
}
```

```

        case 2:
            sc.nextLine();
            String rdName = sc.nextLine();
            int rdDeposit = sc.nextInt();
            int rdDuration = sc.nextInt();
            double rdRate = sc.nextDouble();

            RecurringDeposit rd = new RecurringDeposit(rdName, rdDeposit,
rdDuration, rdRate);
            System.out.printf("Interest for RD: %.1f", rd.calculateInterest());
            break;

        default:
            System.out.println("Invalid Choice");
    }
}

```

**Status :** Correct

**Marks :** 10/10

### 3. Problem Statement

Teena's retail store has implemented a Loyalty Points System to reward customers based on their spending. The program calculates and displays the loyalty points based on whether the customer is a regular or a premium customer.

For regular customers (class Customer), the loyalty points are calculated as:

$$\text{Loyalty points} = \text{amount spent} / 10$$

For premium customers (class PremiumCustomer, which inherits from Customer), the loyalty points are calculated as:

$$\text{Loyalty points} = 2 * (\text{amount spent} / 10)$$

The program should use method overriding for premium customers to calculate their loyalty points. The method that needs to be overridden is calculateLoyaltyPoints in the Customer class.

### ***Input Format***

The first line of input consists of an integer representing the amount spent by the customer.

The second line consists of a string representing the premium customer status:

- "yes" if the customer is a premium customer.
- "no" if the customer is not a premium customer.

### ***Output Format***

The output should display the loyalty points earned based on the amount spent and the customer type.

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 50

yes

Output: 10

### ***Answer***

```
import java.util.Scanner;  
class Customer {  
    protected double amountSpent;  
  
    public Customer(double amountSpent) {  
        this.amountSpent = amountSpent;  
    }  
  
    // Method to calculate loyalty points for regular customers  
    public double calculateLoyaltyPoints() {  
        return amountSpent / 10;  
    }  
}  
  
class PremiumCustomer extends Customer {  
    public PremiumCustomer(double amountSpent) {  
        super(amountSpent);  
    }  
    public double calculateLoyaltyPoints() {  
        return amountSpent / 10 * 2;  
    }  
}
```

```

        super(amountSpent);
    }

    // Overriding the method to calculate loyalty points for premium customers
    @Override
    public double calculateLoyaltyPoints() {
        return 2 * (amountSpent / 10);
    }
}

public class Main {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);

        int amountSpent = scanner.nextInt();

        String isPremium = scanner.next().toLowerCase();

        Customer customer;

        if (isPremium.equals("yes")) {
            customer = new PremiumCustomer();
        } else {
            customer = new Customer();
        }

        int loyaltyPoints = customer.calculateLoyaltyPoints(amountSpent);

        System.out.println(loyaltyPoints);
    }
}

```

#### 4. Problem Statement

Teena is launching a new airline, Boeing747, and needs to calculate the total revenue generated from ticket sales based on the ticket cost and seat availability. Teena's airline offers two types of seats: regular and premium. The ticket cost and seat availability for both types of seats need to be considered for revenue calculation.

To help with this, Teena wants to implement a system using multilevel inheritance with three classes:

Airline: This class will have the ticket cost as an attribute and defines the method `setCost(double cost)` and `double getCost()`.  
Indigo: This class will extend Airline and add the seat availability attribute and defines the method `getSeatAvailability()` and `setSeatAvailability(int seatAvailability)`.  
Boeing747: This class will extend Indigo and include a method `calculateTotalRevenue()` based on the ticket cost and seat availability .

Teena needs to calculate the total revenue using the formula:

Total Revenue = ticket cost \* seat availability

Help Teena implement this system for calculating the revenue of her airline.

#### ***Input Format***

The first line of input consists of a double value, representing the flight's ticket cost.

The second line consists of an integer, representing seat availability.

#### ***Output Format***

The first line of output prints "Ticket Cost: Rs. " followed by a double value representing the ticket cost rounded to one decimal place.

The second line of output prints "Seat Availability: X seats" where X is an integer value representing the seat availability.

The third line of output prints "Total Revenue: Rs. " followed by a double value representing the total revenue rounded to one decimal place.

Refer to the sample output for the exact text and format.

#### ***Sample Test Case***

Input: 1000.0  
100

Output: Ticket Cost: Rs. 1000.0  
Seat Availability: 100 seats  
Total Revenue: Rs. 100000.0

### Answer

```
import java.util.Scanner;  
  
// You are using Java  
import java.util.Scanner;  
  
class Airline {  
    protected double ticketCost;  
  
    public void setCost(double cost) {  
        this.ticketCost = cost;  
    }  
  
    public double getCost() {  
        return ticketCost;  
    }  
}  
  
class Indigo extends Airline {  
    protected int seatAvailability;  
  
    public void setSeatAvailability(int seatAvailability) {  
        this.seatAvailability = seatAvailability;  
    }  
  
    public int getSeatAvailability() {  
        return seatAvailability;  
    }  
}  
  
class Boeing747 extends Indigo {  
    public double calculateTotalRevenue() {  
        return ticketCost * seatAvailability;
